Enzyme kinetics

- Michaelis–Menten: v = Vmax·[S] / (Km + [S])
- Km: substrate concentration at ½ Vmax
- Competitive inhibition raises the apparent Km

Hypothesis testing

$H_0: \mu_1 = \mu_2$ against $H_1: \mu_1 \neq \mu_2$

Reject H_0 when $p \leq \alpha = 0.05$

Diagnostic accuracy

	Disease +	**Disease –**
Test +	TP	FP
Test –	FN	TN

Sensitivity = TP / (TP + FN)

Summary

- Kinetics → rates and affinity
- Statistics → evidence against Ho
- Accuracy → sensitivity and specificity
